# Schedule

Our network diagram is as follows:

To keep our sprint in schedule we first divided tasks and assigned them. This way, in the case where we couldn't find time to meet, we would still be able to do our work. We would check in with each other about progress as well. Based on what we decided to accomplish for sprint 2, we were able to completely finish some of our tasks. Other tasks are in progress and not fully integrated. This is due to time constraints along with busy schedules.

The main takeaway we had was the importance of scope and planning. Having too large a scope increases the chances of incomplete tasks, so we often had to adjust our scope. This helped us achieve our targets and didn't let us stray too far from the schedule.
